

DEVICE AND METHOD OF DISPLAYING PHOTOGRAPHS

ABSTRACT OF THE DISCLOSURE

A device for displaying at least one picture includes a support member and a plaque. The plaque includes a plate member and an adhesive layer on a side of the plate member for adhering the picture to the plate member. A swivel suspends the plaque from the support member so that the plaque freely moves like a mobile. Preferably, the plaque includes an adhesive layer on each side so that pictures can be mounted on each side of the plaque.
